

Crystallographic Information File (CIF)

The Crystallographic Information File (CIF) is a standard text-based format used in materials science and crystallography to store structural data of crystals. Key Features: - Stores atomic positions, lattice parameters, and symmetry information - Widely used for exchanging crystallographic data - Human-readable and machine-readable format Applications: - Material structure analysis - Computational simulations - Database storage of crystal structures Example Content: data_example _cell_length_a 5.43 _cell_length_b 5.43 _cell_length_c 5.43
